The Invisible Internet Browser (I2P Browser) is preconfigured to get your content using the anonymous and private I2P network. In this release, I2P Browser bundles it's own I2P Router, which starts and stops when you open and close the browser application. It does not require an existing I2P router installed. Sometimes it takes a minute or two for I2P to get started for the first time. While you wait, visit the Router Console to get acquainted with all the capabilities of I2P.
